

Track B: 4 Official Skill Package Tracks

WESPARK

Track B: 4 Official Skill Package

Tracks

Build a complete solution by assembling ≥ 6 effective Skills across one unified scenario; all four directions require an installable, testable, and demoable end-to-end closed loop.

1. Overview

Four official Skill package directions, all unified under the following requirements:

Track	Name	Level / Priority	Core Capability Keywords	Acceptance Metrics
SP-A	Collaborative Orchestration Hub Skill Package	L1 Orchestration · P0	Intent Decomposition	Long-horizon Planning
SP-B	Knowledge Evolution Engine Skill Package	L2 Knowledge Evolution · P1	Three-tier Memory	RAG Distillation
SP-C	Platform Support & Multimodal Interaction	L3 Platform Engineering · P1	Tool Routing	Semantic Retrieval

	Skill Package			
SP-D	Organizational Collaboration Office Skill Package	Collaborative Execution · P1	Task Parsing	Relationship Network Workload Splitting

Unified Requirements: Skills must be structurally clear, materials verifiable, and end-to-end demoable; the final deliverable must land on a real-world business scenario where the value can be clearly articulated.

2. SP-A: Collaborative Orchestration Hub Skill Package

Challenge Scenario

Build a virtual collaboration team using open-source multi-agent orchestration frameworks (AgentVerse / AutoGen, etc.). The hub must understand and decompose tasks, design long-horizon plans, dispatch and coordinate multiple role agents, and support adversarial gameplay simulation, swarm emergence observation, collaborative stress testing / fault injection, as well as runtime visualization and monitoring. All Skills must be wired together around the single "Collaborative Orchestration Hub" scenario.

Deliverable Requirements

- ≥ 6 effective Skills forming a complete pipeline around the same collaboration scenario
- Unified trigger word system + shared communication / message schema
- Each Skill submits a SKILL.md + supporting scripts

- Each Skill includes ≥ 20 self-test cases
- Demo main pipeline: Intent Input $\rightarrow$ Task Decomposition / Planning $\rightarrow$ Multi-Agent Division of Labor & Collaboration $\rightarrow$ Result Completion & Monitoring

3. SP-B: Knowledge Evolution Engine Skill Package

Challenge Scenario

Build the underlying operating scenario for knowledge-based intelligent agents. After injecting documents, conversations, and behavior sequences, the system must complete: knowledge graph and RAG knowledge base construction, three-tier memory personalization, lightweight fine-tuning, high-precision semantic retrieval, three-tier intent modeling & evolution prediction, world model state prediction, and multi-constraint decision optimization. All Skills must be wired together around the single "Knowledge Evolution" scenario.

Deliverable Requirements

- ≥ 6 effective Skills forming a closed loop around knowledge, memory, and decision-making
- Unified knowledge / memory access schema
- Each Skill submits a SKILL.md + supporting scripts
- Each Skill includes ≥ 20 self-test cases
- Demo main pipeline: Inject Documents $\rightarrow$ Build Knowledge $\rightarrow$ Personalized Q\&A $\rightarrow$ Produce Decision Recommendation

4. SP-C: Platform Support & Multimodal Interaction Skill Package

Challenge Scenario

Build the runtime support scenario for an intelligent agent platform: enable agents to correctly route and invoke tools, provide high-precision semantic search, generate image-text and other multimodal assets plus digital human facial expressions, conduct A/B evaluation on model performance, and audit the safety of inputs and outputs. All Skills must be wired together around the single "Platform Support & Interaction" scenario.

Deliverable Requirements

- ≥ 6 effective Skills covering tools, retrieval, generation, evaluation, and safety
- Unified tool / interface registration schema
- Each Skill submits a SKILL.md + supporting scripts
- Each Skill includes ≥ 20 self-test cases
- Demo main pipeline: User Request $\rightarrow$ Tool Routing $\rightarrow$ Retrieval / Generation $\rightarrow$ Safety Audit $\rightarrow$ Output Result

5. SP-D: Organizational Collaboration

Office Skill Package

Challenge Scenario

Targeting organizational management scenarios: every member has an intelligent-agent avatar, and they are connected into a group via a "relationship network" of org structures, task collaboration, simple follows, etc. After the user describes a task in one sentence, the system automatically determines the lead and collaborators, then drives the entire closed loop — from task understanding, workload splitting, option comparison, collaborative execution, all the way to outcome delivery.

Deliverable Requirements

- ≥ 6 effective Skills covering the core scenarios across the full task lifecycle
- Deliverables must at least include: parsing, workload splitting, option comparison, execution control, outcome reporting
- All simulation runs are unified under the "Product Launch Preparation" scenario for validation
- Required to run the entire flow from a one-sentence task all the way through multi-person collaboration to completion
- Demo main pipeline: One-sentence Task $\rightarrow$ Multi-option Generation $\rightarrow$ Lead Selection $\rightarrow$ Collaborative Execution $\rightarrow$ Outcome Delivery

6. Core Acceptance Criteria (Applies to Every Track)

Acceptance Dimension	Requirement
Skill Count	≥6 effective Skills
Self-test Coverage	100% self-test pass rate
Trigger Hit Rate	Trigger hit rate ≥90%
Main Pipeline	≥1 end-to-end demoable main pipeline
Delivery Format	Installable, packagable
